INDEPENDENT CLAIM 1

Novelty

The applicant has restricted the subject matter of claim 1 in such a way that the 2-arylacetaldehyde I and the non-enolisable aldehyde compound II are used in the process in a molar ratio of I:II ranging from 1:1.05 to 1:5.

As a result, the present application now meets the requirements of PCT Article 33(2).

D1 discloses the preparation of E-2-(4-fluorophenyl)-3-

(2-trifluoromethylphenyl)-propenal, starting from 2-trifluorobenzaldehyde and fluorophenyl acetaldehyde (example A, page 6). According to D1, 8.4 g sodium hydroxide (0.21 mole) in 40 ml water are added to a solution of 85.5 g **(0.5 mole)** 2-trifluoromethyl benzaldehyde in 300 ml methanol ($V_{\text{MeOH}}:V_{\text{water}} = 7.5:1$). The reaction mixture is cooled and 69 g **(0.5 mole)** 4-fluorophenyl acetaldehyde are added drop by drop. The molar ratio of 2-fluorophenyl acetaldehyde to trifluorobenzaldehyde amounts to 1:1.

D2 discloses the preparation of E-2,3-diphenyl-acrylaldehyde, starting from benzaldehyde and phenyl acetaldehyde in water or ethanol, in the presence of NaOH (pages 391-392). According to D2, 21 g benzaldehyde **(0.2 mole)** and 24 g phenyl acetaldehyde **(0.2 mole)**, 120 ml alcohol, 60 ccm water and 2 g NaOH (0.05 mole) are mixed. At the end of the process, 3g E-2,3-diphenyl-acrylaldehyde (0.01 mole) are produced, with a 5% yield. The molar ratio of phenyl acetaldehyde to benzaldehyde amounts to 1:1.

D3 discloses the preparation of E-phenyl-2-p-tolyl-3-propen-2-al, starting from phenyl acetaldehyde and p-tolualdehyde, in the presence of MeONa, in methanol as solvent, i.e. in a pure organic solvent.

D4 describes the condensation of benzaldehyde and heptanal in the presence of catalysts with bifunctional basic and acid properties. The subject matter of claim 1 is thus novel over D1-D4.

PCT/EP2004/014241

Box No. V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability;
citations and explanations supporting such statementInventive step

The applicant addressed the problem (see page 2 of the description) of devising a process for preparing 2,3-cis-disubstituted 2-arylpropenals with high yield and high stereoselectivity.

The problem is solved by the application in that the reaction of arylpropenal with the non-enolisable aldehyde is carried out in a solvent mixture which includes at least one water-miscible organic solvent and water, and in that the non-enolisable aldehyde is used in excess in relation to the 2-arylacetaldehyde I, and hence in relation to the reaction stoichiometry.

Neither D1 nor D2 give a person skilled in the art any indication on how to improve yield and selectivity.

The use of the claimed solvent mixture and the excess of non-enolisable aldehyde compound II achieves high yields and high stereoselectivity with regard to the cis compound (more than 20:1) (see all the examples).

In the comparative example 14 (page 13), the applicant has further shown that this level of stereoselectivity is not obtained in a pure organic solvent (as in D3, for example) and with the use of an excess of non-enolisable aldehyde. Since D4 does not relate to the preparation of 2,3-cis-substituted aryl-propenals, D4 does not contain any indication on how to avoid the by-products produced during the preparation of 2,3-cis-substituted aryl-propenals.

Box No. V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability;

Consequently, the solution proposed in claim 1 involves an inventive step in relation to D1-D4 (PCT Article 33(3)).

DEPENDENT CLAIMS 2-12

Claims 2-12 are dependent on claim 1 and thus also meet the PCT novelty and inventive step requirements.
